

Workshop 10 – Unit and Integration Testing

In this week's lab you'll be conducting some unit test to a simple node project and adding integration tests to the node part of last week's lab by using mocha

Part A

Task 1 – setting up unit tests

Create a new node project and install mocha by using the instructions in the lecture slides.

npm install mocha --save-dev

Create a file called linearPoint.js. In this file export a function." This function should take 3 inputs m, x and c and return the result of $m \cdot x + c$

Task 2 – Making unit tests

In your unit test file import the function from "linearPoint.js" and create a set of test cases that test the function with the following data:

M	X	C	Expected result
2	1	4	6
2	0	4	4
2	-1	4	2

All test cases must pass

Part B

Task 3 – Installing mocha

Install mocha in the node part of last week's lab project

Task 4 – Creating an integration test

Add a set of test cases for each route that pass. Each route should have at least 2 tests passing.
