

Workshop 11 End to End Testing

In this week's lab you'll create a new branch of an angular project and create a new e2e test.

Task 1 – Create a new branch

Creating a new branch from the repository you committed your workshop 9 workshop. Call the branch "End to End test"

Task 2 – Write an end to end test

Create three e2e test cases for the search function in angular:

- The first should run a search and check to see if the DOM is correctly filled by the results.
- The second should spy on the search function and report if it is run.
- The last one should trigger the validation and check to see if the DOM contains the errors afterwards.
